Question

How effective are cognitive behavioural interventions (e.g. anger management) compared to no intervention at reducing aggression, violence and anger in people within psychiatric and offender populations (prison, hospital or community)?

Clarification of question using *PICO* structure

Patients: Psychiatric and Offender populations
Intervention: Cognitive Behavioural interventions
Comparator: No intervention
Outcome: Reduction in aggression, violence and anger

Clinical and research implications

Limited evidence, from two small RCTs and observational studies included in a systematic review suggests that group CBT interventions may be associated with short-term, post-treatment improvements in measures of anger, aggression and hostility in incarcerated violent offenders. The longer-term effects of group CBT in this population remain unknown, as no study reported follow-up data beyond the end of treatment. There are no consistent data on the effects of individual CBT, the effects of group CBT in other relevant populations, or the effects of CBT on incidence of violent or aggressive behaviour or recidivism rates in violent offenders.

Further research is required to assess the longer-term effects of CBT in relevant populations and to ascertain the optimal format, mode of delivery and duration of CBT.

What does the evidence say?

Number of included studies/reviews (number of participants)

We identified one systematic review¹ and two additional randomised controlled trials (RCTs)^{2,3} which reported results relevant to this evidence summary. The systematic review assessed the effects of psychological therapies on violent behaviour in clinical and forensic settings and included ten studies, of which seven assessed cognitive behavioural therapy (CBT) interventions.¹ Two RCTs compared individual CBT interventions to treatment as usual and social activity therapy (the first RCT was conducted in community dwelling patients with antisocial personality disorder and the second RCT was conducted in inpatients and outpatients with schizophrenia and a history of violence), and one additional very small case series also reported information on the effects of individual CBT; studies reported the effects of CBT on violent and aggressive incidents and measures of anger.¹ Two comparative 'before and after' studies reported data on the effects of group CBT on recidivism rates in violent offenders compared to matched controls, and two additional un-controlled observational studies assessed the effects of different group CBT interventions on measures of anger and violent and aggressive incidents in violent offender and psychiatric in-patients.¹ The duration of follow-up in included studies was generally not reported.¹

The two additional RCTs both assessed group CBT interventions in male prison inmates, compared to treatment as usual.^{2,3} Both studies reported pre- to post-treatment changes in measures of anger or aggression and neither study reported any longer term follow-up data.^{2,3}

Main findings

Individual CBT

The results of studies included in the systematic review were inconsistent; one RCT found that group CBT significantly reduced the occurrence of violent and aggressive incidents compared to social activity therapy (follow-up duration not reported) and one RCT found no difference in violent and aggressive incidents, between the CBT group and the treatment as usual group, over a 12 month follow-up period.¹ Details of studies included in the systematic review, interventions, duration and results were poorly reported and results were not reported for all listed outcome measures.

Group CBT

Two comparative observational studies by the same group, included in the systematic review, provided contradictory results on recidivism rates in violent offenders, however, the larger and more recent study found no significant treatment effect.¹ The systematic review included one additional

observational study (no comparator group) conducted in violent offenders and one in psychiatric in-patients, which reported post-treatment reductions in anger and violent incidents, respectively.¹ The two additional RCTs of CBT compared to usual care in violent offenders, both found that CBT was associated with greater improvements in some measures of anger,² aggression³ and hostility³ immediately post-treatment. However, neither study provided longer-term follow-up data.

Authors' conclusions

Ross et al. (2013) – The authors concluded that their findings provide tentative support for the utility of psychotherapeutic interventions in reducing aggressive behaviour in forensic and psychiatric patients with a history of violent behaviour.

Brazão et al. (2015) – The authors concluded that their study provides preliminary support for the efficacy of 'Growing Pro-social' (GPS), a group rehabilitation programme for antisocial behaviour, in producing clinical changes at an emotional level (anger-trait) and at a cognitive level (paranoia) in adult offenders.

Chen et al. (2014) – The authors concluded that their study findings indicate that Williams LifeSkills Training has the potential to be an effective intervention to reduce overt aggression behaviour in young male violent offenders.

Reliability of conclusions/Strength of evidence

The available evidence was limited. The systematic review was poorly reported and did not provide sufficient details of the included studies (specifically in relation to interventions, study and follow-up duration and numerical results for all outcomes assessed) to allow adequate interpretation. Two additional small RCTs, both with methodological weaknesses, provided some evidence that group CBT may be associated with short term improvements in measures of anger, aggression and hostility in incarcerated violent offenders, however, neither study reported any follow-up assessments beyond the end of treatment.

What do guidelines say?

Neither National Institute for Health and Care Excellence (NICE) nor Scottish Intercollegiate Guidelines Network (SIGN) guidelines comment on the efficacy of cognitive behavioural interventions (e.g. anger management) in reducing aggression, violence and anger in people within psychiatric and offender populations

Ross et al. (2013)	11/2012	<p><i>Participants:</i> Adults aged 16+ with a history or current presentation of violent behaviour. Those in prison, forensic inpatient hospitals or being managed in the community as forensic outpatients were included. Studies with participants whose primary reason for detention was a sexual offence or domestic violence and studies conducted in people with learning disabilities were excluded.</p> <p><i>Intervention:</i> Any psychological intervention, including CBT-based interventions delivered in groups (3 studies) or individually (3 studies); CBT-informed anger management (1 study); Aggression replacement training (ART) (1 study); dramatherapy (1 study); Motivation and engagement (1 study).</p> <p><i>Comparator:</i> -In RCTs (2 studies): Social activity therapy (SAT) (1 study); treatment as usual (1 study)</p>	10 (7 studies of CBT, including 2 RCTs)	<p>This review aimed to assess the effects of psychological therapies on violent behaviour in clinical and forensic settings; studies of any psychological therapy, including CBT, were eligible for inclusion.</p> <p><i>Individual CBT</i> The two RCTs included in the review both assessed individual CBT. The details and duration of the CBT intervention were not reported for either study. One study was conducted with a male majority (87%) of inpatients and outpatients with a diagnosis of schizophrenia and a history of violence. This study compared individual CBT to social activity therapy and found that there were fewer incidents of physical aggression during treatment and follow-up (duration not reported) in the CBT group. However, results were not reported for the four psychometric outcome measures listed and the authors</p>	<p>The review addressed a clearly stated objective and defined appropriately broad inclusion criteria.</p> <p>Six bibliographic databases were searched and a simple search strategy was reported. Electronic searches were supplemented by hand searching of selected journals and contact with study authors.</p>

	<p>-In Pre-post intervention studies (6 studies): Matched non-completers or no comparator</p> <p>-In case series studies (2 studies): No comparator</p> <p><i>Outcome:</i> Psychometric outcome measures and reporting of violent incidents.</p> <p>In RCTs: -1 study: (i) Aggression and offending (MacArthur Community Violence Screening Instrument; MCVSI); (ii) Drug use (Drug Abuse Screening Test; DAST); (iii) Alcohol use (Alcohol Use Disorders Identification Test; AUDIT); (iv) Anxiety and depression (Hospital Anxiety and Depression Rating Scale; HADS); (v) Anger (Novaco Anger Scale and Provocation Inventory; NAS-PI); (vi) Social functioning (Social Functioning Questionnaire; SFQ); (vii) Evaluation of self and others (Brief Core Schema Scales; BCSS)</p> <p>-1 study: (i) Anger (Ward Anger Rating; WARS; and Novaco Anger Scale and Provocation Inventory; NAS-PI); (ii) Psychotic symptoms (Psychotic Symptom Rating Scales; PSYRATS; and (Positive and Negative Syndrome Schedule; PANSS).</p> <p><i>Study design:</i> There were no restrictions on study design; RCTs, controlled trials, cohort studies and case-series were eligible for inclusion: RCTs (2 studies); Pre-</p>	<p>stated that there were no significant changes in anger in either group. The second RCT included only community dwelling violent male participants with antisocial personality disorder and compared individual CBT to treatment as usual (not described). This study found no between group differences in incidences of verbal and physical aggression over the 12 month follow-up period; results were not reported for all outcomes listed including NAS-PI-anger.</p> <p>One additional case series (n=3) reported that CBT reduced post-treatment anger and aggression in all three cases (detailed results and duration of intervention not reported), however, the effect was not maintained at follow-up (duration not reported).</p> <p><i>Group CBT</i> Two studies from the same group assessed the effects on recidivism of a group CBT intervention (details and duration not reported) in violent offenders, compared to a matched group of violent offenders who had not received the intervention. The initial small study (n=22) found no between group difference in non-violent convictions, but 31% fewer violent interventions in the CBT</p>	<p>Two reviewers independently assessed studies for inclusion and extracted data.</p> <p>The methodological quality of included studies was assessed and reported.</p> <p>The use of a narrative synthesis was appropriate, given the different interventions, comparators and study designs included. However, included studies were not described in sufficient detail (e.g. follow-up periods were described as varying between studies, but were not reported for all</p>
--	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

		<p>post interventions (6 studies); case series (2 studies)</p>	<p>group. However, the subsequent larger study (n=112) found no difference in re-offending rates. Follow-up periods were not reported for either study. One observational 'before and after' study assessed the effects of a two-day drama-based CBT intervention in 62 male violent offenders in three high security hospitals; the study did not include a comparator group. This study reported reductions in anger (STAXI-2) pre- to post-intervention and reductions in self-reported anger at three month follow-up. The remaining study was a small (n=12) observational study assessing a brief (two-session) CBT-based intervention in patients on a psychiatric ward who had a history of anger and violence; the study did not include a comparator group. This study found a significant decrease in the numbers of violent and aggressive incidents in the two weeks post-intervention compared to the two weeks prior to the intervention (no further details reported).</p> <p>Numerical results (e.g. absolute numbers of violent incidents) were not reported for any of the included studies.</p>	<p>studies, durations of interventions not reported), and results were not reported for all outcomes listed.</p>

Randomised controlled trials

Author (year)	Inclusion criteria	Number of participants	Summary of results	Risk of bias
Brazão et al (2015)	<p><i>Participants:</i> Male prison inmates aged 19-40 from three Portuguese prisons, remaining in prison for at least 12 months from the start of the program, without (i) cognitive impairment, (ii) active substance use, (iii) being sentenced exclusively for sexual offence and (iv) psychotic disorders.</p> <p><i>Intervention:</i> Growing Pro-Social (GPS), a group rehabilitation programme for antisocial behaviour; consisting of 5 modules over 40 weekly sessions, in addition to treatment as usual.</p> <p><i>Comparator:</i> Treatment as usual; supervision of school frequency, occupational and job-related tasks, and sentence-planning supervision over time.</p> <p><i>Outcome:</i> (i) Perception of negative judgment by others (Other as Shamer Scale; OAS); (ii)</p>	56 (27 in the treatment group and 29 in the control group)	<p>This study aimed to assess the effects to of a structured group CBT program, Growing Pro-Social (GPS), on anger, paranoia, and external shame in male prison inmates.</p> <p>There were no significant differences between the treatment and control groups in demographic or socioeconomic characteristics. Outcome measures were similar in the two groups at baseline. However, participants in the control group scored lower than those in the treatment group on STAXI anger-trait sub-scale; this difference did not reach statistical significance. The mean post-treatment STAXI anger-trait scores were significantly lower in the intervention group (16.29 ± 4.40) than in the control group (19.50 ± 5.79). There was no significant difference between intervention and control groups in post-treatment mean anger-state score. Data were also reported for measures of paranoia and external shame. All outcomes were measured one week after completion of the intervention and no follow-up outcome assessments were reported.</p>	<p>Randomisation used a random number table; no further details of randomisation or allocation concealment procedures were reported.</p> <p>The nature of the intervention precluded blinding of study participants and personnel. Data collection was carried out by psychologists who were not responsible for delivery of the intervention and by the authors of the paper; it was not clear whether the authors were involved in delivery of the intervention.</p> <p>Only participants who completed the study were included in the analyses; three participants from the treatment group and five</p>

	Paranoia (Paranoia Scale); (iii) Anger experience and expression State-Trait Anger Expression Inventory; STAXI).			from the control group did not complete the study. Results were reported for all listed outcomes.
Chen et al. (2014)	<p><i>Participants:</i> Male prison inmates in the Yuela district of China aged 14-24 who were imprisoned due to a violent offence. People were excluded if they had an intellectual disability, schizophrenia, major depression, bipolar disorder or at least one from various medical conditions.</p> <p><i>Intervention:</i> Williams LifeSkills Training, based on cognitive behavioural principles, involving 10 core skill modules delivered to a group over 9 weeks (with a 1 hour individual assessment at week 1, followed by 2 hour sessions from weeks 2-9).</p> <p><i>Comparator:</i> Routine intervention (treatment as usual)</p> <p><i>Outcome:</i> Primary outcome: Aggression (Modified Overt Aggression Scale; MOAS) Secondary outcomes: (i) Impulsiveness</p>	66 (33 in the treatment group and 33 in the control group)	<p>This study aimed to assess the effects of a commercial CBT program (Williams LifeSkills Training) on overt aggressive behaviour in Chinese young male offenders.</p> <p>There were no significant between group differences in demographic or socioeconomic characteristics, previous criminal history, or history of drug abuse. All outcome measures were similar in the two groups, at baseline.</p> <p>There were significantly greater pre- to post-treatment improvements in overall aggression (MOAS) in the treatment group (-4.74 ± 10.53) than in the control group (3.68 ± 10.15). Similar effects were seen for the sub-scales verbal aggression score, auto aggression score and physical aggression score; there were no significant between group differences on the sub-scale aggression against property score. Williams LifeSkills Training was also associated with a significant pre- to post-treatment reduction in hostility on the Cook-Medley Hostility Scale (-2.00 ± 6.21) compared to the</p>	<p>No details of the randomisation of allocation concealment procedures were reported.</p> <p>The nature of the intervention precluded blinding of study participants and personnel. However, outcome assessors and statisticians analysing the data were blinded to treatment group.</p> <p>Two participants from each group were excluded from the primary analysis.</p> <p>Results were reported for all listed outcomes.</p>

	(Barratt Impulsiveness Scale-11; BIS-11); (ii) Hostility (Cook–Medley Hostility Scale; CMHS)		control group (1.10 ± 5.31). Data were also reported for measures of impulsiveness. All outcomes were measured pre- and post-intervention and no follow-up outcome assessments were reported.
